Secure Remote Access Guidelines

Issued Date: 30 June 2015
Effective Date: 30 June 2015

Purpose

This document informs readers of risks associated with remote access, and provides guidance on meeting the state’s remote access requirements.

Scope

This guidance is intended for organizational units managing remote access to University data classified as Confidential or Restricted.

Adherence to this guidance does not absolve an organizational unit of its obligation to meet additional relevant compliance requirements (such as PCI-DSS for credit card information or the HIPAA Security Rule for electronic protected health information). Organizational units should refer to appropriate industry guidance to determine what, if any, additional safeguards are necessary.

The Information Security Office offers consulting services to organizational units in the planning, implementation, and assessment of safeguards.

Background

When unencrypted data is sent or received over the Internet, it can be exposed to unauthorized parties without the knowledge of the sender or the intended recipient. When data is accessed remotely, it is difficult to distinguish between a legitimate user and someone using stolen credentials. Stolen credentials are a leading cause for data breaches. For these reasons, organizations require specific safeguards (such as encryption and multifactor authentication) for individuals accessing data remotely.

In accordance with South Carolina Provisos 117.113 (2014) and 101.32 (2014), the state’s Division of Information Security has issued security requirements for all state agencies, published in April 2014 and effective July 2016. The requirements are wide reaching and based on the NIST Special Publications 800 series. Per University policy, Responsibility and Acceptable Use of Data, Technology, and User Credentials, the University Information Security Office may issue guidance on implementing appropriate safeguards. Following this guidance is optional, however compliance with the state’s requirements is not.

Definitions

**Remote Access**
The ability of an organization’s users to access its nonpublic computing resources from locations other than the organization’s facilities⁶.

**User**
Any person(s) accessing University information technology assets, including but not limited to: students, faculty, staff, contractors, clients, consultants, invited guests, and others working at or for the University.

Related Roles and Responsibilities (from USC policy)

**IT Staff / Data Custodians**

- System administrators or staff assigned the responsibility of maintaining or supporting University information systems or assets will be responsible for implementing requirements outlined in [Responsibility and Acceptable Use of Data, Technology, and User Credentials] and established standards and procedures⁷.
- Data Custodians will implement policies, standards, guidelines, and other requirements applicable to Institutional Data and information systems through their respective roles⁸.

**Data Steward**

- Data Stewards determine data classification of data elements and information systems⁹.
- [E]ach Data Steward is responsible for the following with respect to Institutional Data under his or her care: understand and apply security and privacy standards, guidelines, and practices; determine data classification of data elements...¹⁰
