Some Questions that Challenge. Grades six and above

See NO 13 for definitions of exa, peta, nano, pico, femto atto, zept etc.

Definition of **Angstrom** Å

An **Angstrom** Å is a unit of length equal to 10^{-10} meters

1. Which is bigger a nanometer or an Angstrom? Answer:	
2. Which is bigger a picometer or femtometer? Answer:	
3. Which is bigger a zeptometer or attometer? Answer	
4. Which is bigger a exameter or petameter? Answer:	
5. True or False $\mathbf{\mathring{A}} = 100$ picometres Answer:	
Order of Magnitude: The number of times we would have to multiple or divide by 10 to convert one size to the other. Comparing numbers of widely different size we use Ratios!	
Examples: Determine the order of magnitude difference in the sizes of the radii for:	
(a) The solar system (10 ¹² meter) compared with Earth (10 ⁷ meter) (b) Protons (10 ⁻¹⁵ meter) compared with Milky Way (10 ²¹ meter) (c) Atoms (10 ⁻¹⁰ meter) compared with neutrons (10 ⁻¹⁵ meter)	
Answer: a) 10^{12} meter/ 10^7 meter = 10^5 Order 5 larger Solar system than Earth (b) 10^{21} meter/ 10^{-15} meter = 10^{36} Order 36 larger Milky Way than Protons c) 10^{-10} meter/ 10^{-15} meter = 10^5 order 5 larger Atoms than neutrons	
For each of the following pairs, determine the order of magnitude difference:	
6. The radius of the sun (10^9 meters) and the radius of the Milky Way (10^{21} meters)	Ans:
7. The radius of a hydrogen atom (10^{-11} meter) and the radius of a proton (10^{-15} meter)	ius Ans:
8. How many orders of magnitude greater is a kilometer than a meter? Than a millimeter?	
	Ans:
9. An ant is roughly 10^{-3} meter in length and the average human roughly one meter.	
How many times longer is a human than an ant?	Ans:
10. A millimeter and a gigameter	Ans:
