Revisiting Cervical Cancer Prevention and Control

Featuring Dr. Heather Brandt
Professor, Arnold School of Public Health

January is Cervical Cancer Awareness Month. Recent trends in cervical cancer incidence and mortality have remained relatively stable since dramatic reductions in mortality after introduction of the Pap test in the 1950s. However, cervical cancer screening has declined nationally. HPV vaccination rates which prevent cervical cancer have improved nationally but less so in areas with the greatest burden of disease. In this seminar, Dr. Brandt will revisit cervical cancer prevention and control in the post-vaccine era.
